

Official Rulebook for Threads of Continuity

Objective

The objective of Threads of Continuity is to be the first player to weave three Tapestries of Reality. The game, though a competitive experience, will require working with your competitors to steer the game in a certain direction, for you cannot do it alone. The reality is slowly collapsing, and you must try to be the first one out of this reality by beating your opponents. Every action that each player makes will affect all players in the subsequent rounds. Maybe you want to sabotage your opponents, or maybe you need to form a temporary alliance to get what you want. Maybe you'll change the rules and win diplomatically. The universe is yours to shape how you wish, but no matter what you do, you must get out before it's all gone.

Game Structure

1. Player Composition and Requirements

1.1 Requirements for Play

- 3-5 players
- 1 notebook for each player
- 1 pen for each player
- 2 d6 dice
- 1 d100 die
- Methods for tracking ToC, TB, SN, QR, DR, and ToR
- Method for logging spent resources

1.2 Setup

1.2.1 Player Turn Order

1. All players will roll both dice and multiply the number together.
2. Players will now divide that number by their birth month.
3. Then take that number and add your birth day.
4. Turn order is determined in ascending order.
 - If the time is after 6 o'clock, play in reverse order.

1.2.2 Player Starting Resources

Every player starts with the following:

- 5 Threads of Continuity
- 2 Dimensional Ripples
- 1 Spatial Node
- 2 Quantum Residues

1.2.2.1 Resource Tracking

All players must track the number of each resource they have spent in a round. This number will be used to determine the Total Resource Usage at the start of the next round. This can be done by any method of the player's choosing.

Note: "Lowering" a resource counts towards the spending of that resource.

2. Game Phases

2.1 Game Phases

1. Preliminary Phase
2. Resource Collection Phase
3. Merging Phase
4. Weaving Phase
5. Reconciliation Phase
6. End Phase

2.1.1 Preliminary Phase

This first phase is in place to set the starting Reality Constant and the Weaving Coefficients. These values must be recalculated at the start of each round and affect all players for the duration of the round. See [New Coefficient Formula](#) and [Reality Constant Formula](#) for information on how to do this. This is only to be done once before the first player's turn, not at the start of each player's turn.

Players may also opt to skip their turn entirely to reduce their QR by 10.

2.1.2 Resource Collection Phase

This phase focuses on collecting resources needed for the rest of the turn and the rest of the game. The phase plays out as follows:

1. Collect any resources from PN that you may have.
2. The player will roll the two d6 dice. If the resulting sum of the dice is:
 - 2-5: Gain 3 ToC
 - 6-8: Gain 2 DR

- 9-10: Gain 2 SN
- 11-12: Gain 1 TB

2.1.3 Merging Phase

This phase focuses on using collected resources and turning them into SN or TB, exchanging resources, trading, alliance building, and sabotage.

Purchasing Production Nodes

Production Nodes are crucial to mid- and late-game success. See [Production Nodes](#) for more info.

2.1.3.3 Trading and Public Offers

See the [Trading and Public Offers](#) rules for more info.

2.1.3.4 Alliances and Bribery

This is the phase in which players are encouraged to participate in any alliance building or bribery, but is not required. See [Alliances and Bribery](#) for more information on how these are accomplished.

2.1.3.5 Possible Usage Tracking

At the end of the Merging Phase, the player must make note of how many of each resource they have. This will be used for calculating the Total Possible Usage at the start of the next turn. Mark this down on the Player Resource Tracker sheet.

2.1.4 Weaving Phase

2.1.4.1 Actions

The player may choose three actions from the following:

Resource Manipulation

- Spend 3 ToC or 2 SN to lower QR by 1.
- Spend 2 ToC or 1 SN to lower DR by 1.
- Exchange 4 ToC for 1 SN.
- Spend 3 SN to gain 1 TB.

Player Interaction

- Spend 5 ToC to force another player to lose 1 SN.
- Spend 6 ToC to protect your SN from player effects until your next turn.
- Spend 10 DR to force an opponent to lose 1 PN of their choice.
- Spend 7 DR to force another player to discard 2 resources of their choice.

Special Actions

- Spend 15 DR to trigger an Ethereal Chaos Event (ECE). Forcing an ECE also requires the player to skip their next turn.
- Spend 8 ToC and 3 TB to force the Reality Constant (RC) to increase by 3.

Resource Gain Options

- Spend 5 ToC to gain 2 DR.
- Gain 1 QR and roll a d6. On a 4-6, gain an additional QR.
- Gain 2 DR and force an opponent to gain 2 QR.

Weaving-Related Actions

- Spend 10 SN to reduce the RC by 5.
- Spend 5 TB to reduce another player's Weaving Score (WS) by 2 for their next attempt.
- Perform a Weave Attempt (See Weaving Rules for more info)

2.1.5 Reconciliation Phase

During this phase, players must resolve any penalties.

- For every 5 DR a player has, they must gain 1 QR.
- If a player has 20 or more QR, they have created an unstable timeline and must forfeit their next turn, discarding their hand, losing 5 QR and 5 ToC.
- If a player has 10 or more DR, they must roll a d6 dice:

- If the roll is a 5, an ethereal chaos event has begun and the player must follow the [Ethereal Chaos Procedure](#).
- If a player has 15 or more DR, they must roll a d6 dice:
 - If the roll is a 1 or a 5, an ethereal chaos event has begun and the player must follow the [Ethereal Chaos Procedure](#).

2.1.6 Ending Phase

During this phase, the player must do the following:

1. Ensure all resources are accurate, including any penalties that must be resolved.
2. The player may choose to discard their entire hand for the cost of 3 ToC and draw 3 cards.
3. Update the [inflation](#) tracker based on resource production for this round.

Game End Conditions

The game is won by either being the first to [Weave 3 ToR](#), or win via a [Dimensional Monopoly](#).

The game ends immediately if the Reality Constant ever hits 100 or higher. At this point, all players lose as reality has collapsed from the overwhelming amount of chaos.

New Coefficient Formula

To determine the weight of resources and the coefficients thereof, players must first determine how much one resource dominated a round. To find this out, players must use the following formula, having totaled the Resource Usage and Possible Usage of all players to determine the TRU and the TPU:

Scaling Factor = $((\text{Total Resource Usage} / \text{Total Possible Usage}) - 0.6)^2$

Coefficient Adjustment = Base Coefficient $\times (1 \pm \text{Scaling Factor})$

Adjustment Direction:

- If Usage > 50%: Subtract Scaling Factor (Overuse Penalty)
- If Usage < 50%: Add Scaling Factor (Neglect Bonus)
- If Usage = 50%: No change to the Scaling Factor

The players will do this at the start of each round and mark down what the new coefficients are for that round.

This formula weighs resources by how much they are used in the round. Resources that are used heavily will have a lesser impact on the likelihood of success creating a ToR, while resources that are barely used throughout the round will have a greater impact.

Reality Constant Formula

To determine the Reality Constant for the round, use the following formula:

$$RC = \text{Base RC} + R^2$$

Where the Base RC is the RC from the previous round and R is the current round number.

Game Style	Suggested Starting Base RC	Example Progression (R=1,2,3,...)
Casual/ Introductory	5	RC = 5, 6, 9, 14, 21, ...
Standard	10	RC = 10, 11, 14, 19, 26, ...
Hardcore	15	RC = 15, 16, 19, 24, 31, ...

As the game progresses, the RC will become increasingly unstable as the universe becomes more chaotic. This will force players to both act tactfully and adapt to the changing landscape as the game goes on, as well as fighting against the collapsing reality.

See [Game Modifiers](#) for different variations.

Production Nodes (PNs)

Production Nodes (PNs) are structures that generate resources over time. Players can create and upgrade these nodes to **generate resources** for **weaving attempts** or **upgrades**. PNs provide a critical way to scale up resource generation, but they also introduce risks, particularly as inflation affects overproduction.

1. Creating a Production Node

To create a PN, a player must:

1. Pay the required resources to establish the node.
2. Choose which resource the PN will generate.

Base Creation Costs

Resource	Base Creation Cost (Level 1)	Output per Round
ToC Node	6 DR + 2 ToC	1 ToC
DR Node	8 DR	1 DR
TB Node	4 ToC + 3 DR	1 TB
SN Node	5 DR + 1 ToC	1 SN

Once a PN is purchased, the player will not start collecting resources from it until their following turn.

2. Upgrading a Production Node

Players can **upgrade Production Nodes** to increase their **resource output**. Each level of upgrade improves the output, but upgrading also requires **additional resources** and **cards of the same suit**.

Upgrade Requirements:

Upgrade Level	Cost (ToC Node)	Cost (DR Node)	Cost (TB Node)	Cost (SN Node)	New Output per Round
Level 2	8 DR + 2 ToC	10 DR	6 DR + 3 ToC	7 DR + 1 ToC	+1 unit of resource
Level 3	12 DR + 3 ToC	14 DR	8 DR + 4 ToC	10 DR + 2 ToC	+1 unit of resource
Level 4+	16 DR + 4 ToC	18 DR	10 DR + 5 ToC	14 DR + 3 ToC	+1 unit of resource

3. Production Node Efficiency and Inflation

As resources are generated, **inflation** can reduce the effectiveness of nodes. Higher inflation reduces the **output efficiency** of nodes, creating a challenge for players to manage overproduction.

Inflation Tier	PN Output Efficiency
Stable	100% (Full Output)
Moderate	90% of normal output
High	75% of normal output
Severe	50% of normal output

4. Node Sabotage and Resource Redistribution

Players can **sabotage** another player's node to decrease their resource production. Sabotage allows players to **disrupt the competition**, particularly when a resource becomes inflated.

Sabotage Rules:

- **Cost to Sabotage:**

- Spend 3 DR or 5 ToC and roll an even number on a d6 to sabotage an opponent's PN.
- The sabotaged PN's output is reduced by **50%** for one round.
- **Resource Redistribution:**
 - When sabotaging a PN, the saboteur gains **half** of the lost resources for the round.

Example:

If Player A's **ToC Node** is sabotaged, and it produces 12 ToC per round, Player A will only receive 6 ToC for that round, while the saboteur gains 3 ToC from the sabotage.

5. Shared Production Nodes

Players can **share their PNs** with one another to increase the resource generation for a period of time. This mechanic encourages **collaboration**, and an [Alliance](#) can be created to share PN.

Trading and Public Offers

Trading

Trading can only be done during a player's Merging Phase. During this phase, if a player chooses, they may propose a trade to another player.

The trading process is as follows:

1. The player wishing to trade must formally declare the desired trade on paper and read it aloud for all players to hear.
2. The player receiving the trade offer can either accept the trade, reject it, or propose a counteroffer.
 1. If the receiving player accepts the trade, they must write "ACCEPT" on the contract and both players must sign the bottom of the trade agreement. Once signed, the trade agreement is set aside for future reference. The players must then adjust their resource count accordingly.
 2. If the receiving player rejects the trade, they must write "REJECT" on the contract and both players must sign the bottom of the trade agreement. Once signed, the trade agreement is set aside for future reference.
 3. If the receiving player wishes to propose a counteroffer, they must follow the process:
 1. The receiving player must cross each item of dispute on the trade agreement off with a single line through the center.
 2. The receiving player must then write out their counteroffer on the paper, read it aloud for all players to hear, and the process starts from the beginning.

Public Offers

Public offers can only be submitted, read, and accepted during a player's Merging Phase. During this phase, if a player chooses, they may submit a public offer to the other players. The player submitting the PO must write out their offer discreetly on a piece of paper, sign in, fold the paper up so that none may see its details, and then place it in the center of the table. There are no formal rules on the format or requirements of a PO.

At this point, any player may pick up and look at the sheet without sharing its details publicly. That player may accept the PO by signing the sheet and handing it back to the player who submitted it. The PO has been accepted and it must be carried out, at which point, the offer does not need to be made public.

If a player picks up the PO and does not accept it, they must return it to the center of the table without sharing its details publicly. This was their only chance to accept the offer and they may not return to it later on. If all players view the PO and no one accepts it, the PO is removed from the center of the table and out of the game. Otherwise, the PO will remain in the center of the table until it's either accepted by a player or all players have declined it.

Alliances and Bribery

Alliances

Alliances can be formed only during the Weaving Phase of a player's turn. To form an alliance, a player must write out an Alliance Proposal Form (APF) that they will then send discreetly to the player with whom they wish to form an alliance. The terms of the alliance do not need to be shared with anyone other than the players in the proposed alliance.

The form must specify the following:

1. The duration of the alliance, measured by the accomplishment of a goal, up to a certain round number or RC
 1. Example: "The alliance will last until 25 SN are crafted, until round 5, or if the RC reaches 40"
2. What resources the alliance will share (if any)
 1. Example: "The alliance will share all ToC and DR. If any are spent by a member of the alliance the amount will be taken out of a combined pool"
3. How are resources
4. What conditions will break the alliance, and what (if any) penalties will result from it.
 1. Example: "If any member of the alliance exceeds 15 QR or crafts a ToR, the alliance will be broken with a 10 ToC penalty imposed on the player that broke the alliance"

At this point, once the APF is filled out, the player(s) in being proposed to may read through the APF and do one of the following:

1. Accept the terms as-is, indicating such on the APF, sign the APF, and return it to the player who made the proposal.

2. Reject the alliance proposal out right, indicating such on the APF, sign the APF, and return it to the player who made the proposal.
3. Cross off items they do not want and change them, forming a counteroffer, which then must be given back to the initial player for review. This process may go on until the final APF is either accepted or rejected by either player.

Bribery

Bribes can be sent by players only during the Weaving Phase. A bribe is not required to be made publicly known. The player wishing to send a bribe must write it out on paper before handing it to the player whom they wish to try and bribe. There is no formal structure on how a bribe may be written up. The player receiving the bribe may sign their initials on it discreetly indicating approval with a letter "A" next to their initials, and a letter "R" indicating rejection, and handed back to the briber. There are no counteroffers.

Weaving Rules

A Tapestry of Reality can be constructed only during the Weaving Phase, in which case, to attempt to weave a ToR, the player must use the following formula to determine what their ToR success chance is:

$$\text{Weaving Score (WS)} = (\alpha \text{ TB} + \beta \text{ SN} + \gamma \text{ ToC}) / (\delta \text{ DR} + \varepsilon \text{ QR})^*$$

Where α , β , γ , δ , and ε are weighted coefficients that are dynamically adjusted (at the start of the game, their base weights are 1.2, 1.05, 1, 1.1, and 1 respectively) See [New Coefficient Formula](#) for information on how to do this. The player can use however many resources of each kind they want to weave a ToR, excluding DR and QR, which must all be accounted for in the equation, keeping in mind that they will still lose all those resources even if the weave attempt is unsuccessful (except DR and QR).

The player will then take their WS and compare that to the ToR Success Threshold determined using the following formula:

$$\text{ToRST} = k \times \ln(\text{RC} + 1)$$

Where k is a scaling factor equal to 1.5.

To determine if the attempt was successful, the player will compare their WS with the ToRST number. The following formula is used to determine the Probability Threshold:

$$\text{PT} = r \times (\text{WS} / \text{ToRST}) \times 100$$

Where r is a scaling factor equal to 1.5

PT is rounded up to the nearest whole number.

The player will then roll a d100:

- If the roll is $\leq$ PT, the ToR weave attempt is successful.
 - If the ToR weave attempt is successful, the RC goes down by 2 points at the start of the next round after its initial calculation.
 - Player pays the cost of the ToR weave attempt.
- If the roll is $>$ PT, the ToR weave attempt is unsuccessful.

- If the ToR weave attempt is unsuccessful, the RC goes up by 1 point at the start of the next round after its initial calculation.
- Player pays the cost of the ToR weave attempt.

Ethereal Chaos Procedure

During an Ethereal Chaos event, the player who caused the Ethereal Chaos event may choose to resolve it with one of the following methods:

1. Nebula Flush

- **Effect:**
 - The initiating player loses **all TB, SN, and ToC**.
 - All other players **gain 5 QR** and **lose 2 DR**.
 - **RC increases by 2** at the start of the next round.

2. Nebula Reset

- **Effect:**
 - All other players reset **all resources to 0**.
 - The initiating player **gains 10 QR** and must forfeit their next turn.
 - **RC increases by 3** at the start of the next round.

3. Nebula Collapse

- **Effect:**
 - All players (including the initiator):
 - Gain **15 QR** and **10 DR**.
 - Lose **50% of their TB** (rounding down).
 - Lose **all SN** over 5.
 - **RC increases by 5** at the start of the next round.

4. Nebula Fracture

- **Effect:**
 - Divide all players (including the initiator) into two groups, "**Fissure A**" and "**Fissure B**" (chosen by the initiator).

- Each group can only interact within itself (trade, sabotage, etc.) for the next **two rounds**.
- Players in the group with fewer members gain +5 **QR** each.
- **RC increases by 1 per round** for the duration of the split.

5. Nebula Conflagration

- **Effect:**
 - All Production Nodes (PNs) are rendered inactive for **one round**
 - Players with **4 or more PNs** must lose one of their choice.
 - **RC increases by 4** at the start of the next round.

Advanced Nebula Rescue Procedure

If the player chooses to try and rescue the Nebula from an Ethereal Chaos event, they must follow the [Advanced Nebula Rescue Procedure](#).

Advanced Nebula Rescue Procedure (ANRP)

Overview

The ANRP is an advanced option to mitigate an Ethereal Chaos Event at significant risk and cost. Players must roll dice to determine success, with outcomes depending on the Reality Constant (RC) and the dice results.

Steps for the ANRP

1. Roll the RC Modifier:

- Roll 2d6 to determine the RC Modifier for this procedure:
 - **2-6:** +1 RC.
 - **7-10:** No change to RC.
 - **11-12:** -1 RC.

2. Roll for Rescue Outcome:

- Add the RC to the sum of the **2d6 roll** to determine the "Rescue Score" (RS).
- Compare the RS to the following thresholds to determine the outcome:

Rescue Score	Outcome
42+	Failure: RC +2. Lose 10 ToC and 10 DR. All other players gain 5 QR.
30-41	Partial Success: RC -1. Gain 2 ToC, lose 1 QR, no other effects.
18-29	Moderate Success: RC -2. Gain 5 ToC, lose 3 QR, and all players lose 1 DR.
2-17	Critical Success: RC -3. Gain 10 ToC, lose 5 QR, and all players lose 2 DR.

3. Pay the Rescue Cost:

- The player attempting the ANRP must pay **8 DR** and **3 TB** to initiate. If they cannot pay, the ANRP fails immediately, and the RC increases by 3.

4. **Outcome Distribution:**

- Other players gain **20% of any resource rewards** from a successful rescue but also share **10% of any penalties** in case of failure.

Special Rule

If a player rolls two 6s during the Rescue Outcome roll, they trigger an **Ultimate Chaos Surge**:

- The RC increases by 5, and all players lose half their resources.
- The initiating player gains **immunity** to QR penalties for the next two rounds.

Inflation System

The Inflation System introduces global economic pressures that affect resource production, trade, and the Reality Constant (RC). Inflation is based on the total production of each resource across all players during a round and imposes penalties for overproduction.

1. Inflation Triggers and Tiers

Inflation is evaluated for each resource at the end of every round.

- **Threshold:** A fixed value for each resource. Base threshold for each resource:
 - ToC: 40
 - TB: 25
 - QR: 60
 - DR: 20
 - SN: 30
- **Tiers:** The level of inflation depends on how much total production exceeds the threshold.

Tier	Condition	Effects
Stable	Production $\leq$ Threshold	No inflation effects.
Moderate	Threshold < Production $\leq$ Threshold $\times 1.5$	PNs produce 90%; +10% trade penalty; +.5 RC per 10 units over threshold.
High	Threshold $\times 1.5$ < Production $\leq$ Threshold $\times 2$	PNs produce 75%; +25% trade penalty; +1 RC per 10 units over threshold.
Severe	Production > Threshold $\times 2$	PNs produce 50%; +50% trade penalty; +1.5 RC per

		10 units over threshold.
--	--	--------------------------

2. Inflation Effects

Aspect	Effect
PN Output	Reduced efficiency: 90% (Moderate), 75% (High), 50% (Severe).
Trade Value	Resources lose value in trades: -10% (Moderate), -25% (High), -50% (Severe).
RC Growth	Adds +1 to RC for every 10 units of overproduction above the threshold.
Upgrade Costs	Optional: Increase PN upgrade costs by +10%/20% for inflated resources.

3. Gameplay Flow Example

1. Production Nodes Generate Resources:

- Player A produces 20 ToC, Player B produces 15 ToC, and Player C produces 10 ToC.
- Total production = 45 ToC.

2. Inflation Tier Evaluation:

- Threshold = 30 ToC.
- Total production exceeds **Threshold × 1.5 (45) → Moderate Inflation** for ToC.

3. Inflation Effects:

- **PN Output:** ToC PNs produce only 90% output next round.

- **RC Growth:** ($45 - 30 = 15$), so RC increases by ($\lfloor 15 / 10 \rfloor = 1$).
- **Trade Penalty:** Player A tries to trade 10 ToC $\rightarrow$ Effective trade value = ($10 \times 0.9 = 9$).

Dimensional Monopoly Win Condition

Players may choose to focus on **economic supremacy** by achieving a state of **Dimensional Monopoly**, where they dominate resource production across the game.

1. Win Condition

A player wins by controlling **50% or more of the total global resource production** for **3 consecutive rounds**.

1.1 Key Elements:

- **Total Global Production:**
The sum of all resources (ToC, DR, TB, SN) produced across all players' Production Nodes (PNs).
- **Control Threshold:**
A player must produce **at least 50%** of the total global production during a round to be considered "in control."
- **Consistency:**
Control must be maintained for **3 consecutive rounds** to achieve Dimensional Monopoly.

2. Tracking Production Control

To track progress toward Dimensional Monopoly, calculate each player's **percentage of total global production** at the end of each round using the following formula:

Production Share (%) = (Player's Total Production / Global Production) × 100

2.1 Example Calculation:

- **Player A's Total Production:** 20 resources (10 ToC, 5 DR, 3 TB, 2 SN).
- **Global Production:** 50 resources (sum of all players).
- **Player A's Production Share:**
 $(20 / 50) \times 100 = 40\%$

If a player's **Production Share** meets or exceeds **50%**, they are considered "in control" for that round.

Challenges

Challenges can be done to any item (any rule, action, decision, progression, or choice that has already occurred--anything that happens in the game due to player action) immediately after the action being challenged. If a second action has occurred since the action a player wants to challenge has occurred, that action can no longer be challenged. Challenges go through four phases:

1. Official Documentation of Challenge Phase
2. Initial Argument Phase
3. Mutual Deliberation Phase
4. Official Documentation of Final Decision Phase

1. Official Documentation of Challenge Phase

When a player challenges anything in the game, it must first be written down in summary in the notebook. All players must read the document and come to a unanimous decision as to what is being challenged.

2. Initial Argument Phase

Then, the player must give a speech to the rest of the players explaining why they are challenging the item lasting no less than 120 seconds (announcing "minimum!" at this point), and not more than 170 seconds (announcing "time's up!" at this point). The player being challenged must time them; if the player is challenging a game rule, then the player with the most ToC must time them.

Please note that a challenge is *not* a [Game Rule Change Proposal](#).

Once the challenger presents their argument, the player being challenged may offer a counter-argument lasting no less than 75 seconds (announcing "minimum!" at this point), and not more than 150 seconds (announcing "time's up!" at this point). This player must be timed by the person challenging them.

3. Mutual Deliberation Phase

Once both parties have given their verbal arguments, the challenge moves to the deliberation phase in which all of the players engage in conversation regarding the challenge. This phase has no time limit and is only officially done when all players have unanimously decided that the deliberation phase is completed.

4. Official Documentation of Final Decision Phase

A super majority decision in favor of the challenge is required for the challenge to pass. Those in favor must sign the challenge document on the left side of the document under the written challenge, at the bottom of the document. Those opposed must sign the document on the right side. This document, once signed by all, will be set aside for reference later. Otherwise, if the challenge does not pass, the original item goes into play normally.

In the event that a challenge is successful, the player that was challenged must undo all actions from that round that lead to the item being challenged and proceed with their turn.

Game Rule Change Proposal

A Game Rule Change Proposal (GRCP) can be initiated by any player only during their own Merging Phase of their current turn. A GRCP is completed across 6 phases:

1. Documentation of the GRCP
2. Initial Vote for the GRCP
3. Initial Argument for the GRCP
4. Mutual Deliberations Regarding the GRCP
5. Signing of the Final Decision of the GRCP
6. Documentation of the Final Decision of the GRCP

1. Documentation of the GRCP

The player bringing forth the GRCP must present the proposal in writing, detailing the current rule, what they want changed about that rule, and the reason for the change. After which, all players must agree unanimously on what is being proposed. Once agreed upon, all players must initial at the top of the document on the right side of the proposal.

2. Initial Vote for the GRCP

At this stage, there will be an initial, verbal vote for the GRCP. If there is a super majority in favor, the GRCP passes and the process skips to the Signing of the Final Decision of the GRCP phase.

If the initial vote fails, move onto the next phase below.

3. Initial Argument

The player bringing forth the GRCP must, at this stage, present a verbal argument lasting at least 90 seconds (announcing "minimum!" at this point), but not

exceeding 120 seconds (announcing "time's up!" at this point). The time is to be kept by the person who has the lowest number of QRs.

4. Mutual Deliberations Regarding the GRCP

At this stage, all players will discuss the GRCP in question. The proposal may be adjusted by the players upon a unanimous agreement, wherein the player who initiated the GRCP will write in the changes to the GRCP on their initial document from phase 1. All players must initial next to the change.

If there are no adjustments, move onto the next phase.

5. Signing of the Final Decision Regarding the GRCP

This stage of the GRCP process is for all players who are voting in favor of the GRCP to sign at the bottom of the GRCP document, on the right side under the written proposal. All those opposed must sign on the left side.

6. Documentation of the Final Decision of the GRCP

The final stage of the GRCP process includes the initiator of the GRCP to write in the official language of the new rule onto the Rule Adjustments Sheet. The final and signed GRCP will be archived under the Rule Adjustment Sheet for future reference.

Note:

Any rule in the game can be changed under a GRCP.

Game Modifiers

Reality Constant Modifiers

If the players wish for a more stable reality that can handle more chaos and, thus, allowing for more time in the game, they may opt to use the following formula to determine the RC:

$$RC = \text{Base RC} + R^{1.5}$$

If the players wish for a more chaotic reality with much higher stakes, they can choose to use the following formula to determine the RC:

$$RC = \text{Base RC} + 2^R$$

Game Modifiers for 2-Player Game

1. **Inflation Threshold Adjustment:** Reduce all resource inflation thresholds by 25% to account for lower overall production. For example, if the ToC inflation threshold is normally 40, reduce it to 30.
2. **PN Sabotage Cost Reduction:** Reduce the cost to sabotage a PN by 1 DR or 2 ToC, making interaction more critical in a smaller player pool.
3. **Trade Ban:** Trading is disallowed since there are no alliances to form in a competitive 2-player scenario. Instead, allow public offers to be made once per turn.
4. **RC Growth Rate Adjustment:** Increase RC growth by +1 at the end of every round to reflect the faster pace of a 2-player game.

Game Modifiers for Solo Game

Victory Conditions: The player must weave **3 Tapestries of Reality** before the RC reaches 50. If the RC hits or exceeds 50, the player loses immediately.

1. **RC Growth:** Increase the RC by **+3 per round** to create a constant pressure on the player.

2. **Resource Generation:** At the start of each round, roll **2d6** to determine your resource gains:
 - **2-5:** Gain 3 ToC.
 - **6-8:** Gain 2 DR.
 - **9-10:** Gain 2 SN.
 - **11-12:** Gain 1 TB.
3. **Production Node Restriction:** The player may only create or upgrade **1 PN per turn**, reflecting the challenge of limited resources and time.
4. **Penalties for Delays:** For every round the player fails to attempt a weave, gain **1 QR** and increase RC by **+1**.
5. **Inflation Adjustment:** Reduce all inflation thresholds by **50%**, making it harder to sustain overproduction.
